Polarographic reduction of boric acid. Wiktor, Kemiola
and Jerzy Witwicki (Univ. Warsaw). *Revue Chim.*
28, 847 (1954) (summary). — A polarographic re-
duction wave of a kinetic character is obtained for 0.01M
 H_2BO_3 in 0.001M Me_4NI , with a half-wave potential of
-1.0 V. Two waves are obtained for 0.001M H_2BO_3 in
0.0003M Me_4NI , with similar half-wave potentials, one of
kinetic and one of diffusive type. The height of the waves
amounts to only a few percent of the Ilkovic value.

Title: Chromato-polarographic Investigations. V. Indirect Determination of Amino Acids in the Effluent Solution from a Chromatographic Column. VI. On Possible Utilization of Maxima for the Detection of Organic Substances in the Effluent Solution from a Chromatographic Column

Original
Periodical: Badania chromato-polarograficzne. V. Posrednie oznaczanie aminokwasow w wycieku z kolumny chromatograficznej. VI. O mozliwosci wyzyskania maksimow do wykrywania substancji organicznych w wycieku z kolumny chromatograficznej, Roczn. chem., 1955, 29, No 4, 1153-1155; 1157-1159; Polish; English resume

Abstract: V. Amino acids are lixiviated from the chromatographic column with 0.001 M solution of $(\text{NH}_4)_2\text{SO}_4$. The effluent is passed through a

Card 1/2

Poland/Analytical Chemistry - General Questions, G-1

Abst Journal: Referat Zhur - Khimiya, No 19, 1956, 61804

Abstract: tube containing copper phosphate (Jones, T. S. G., Biochem. J., 1948, 42, 59) into a cell; polarography is carried out at 1.4 v. The Cu-complexes formed are reduced at a Hg-drop electrode of the V-301 polarograph of Geyrovskiy. Separation of valine and glyco-coll has been effected.

VI. In chromatopolarographic analysis of technical DDT the 2 peaks corresponding to reduction of DDT-isomers are preceded by a minimum. Separation of components was effected by passing aqueous CH_3OH through a column with powdered rubber that had been allowed to swell in iso-octane. The minimum corresponds to the appearance in the effluent solution of a surface-active substance. Communication IV, see Referat Zhur - Khimiya, 1956, 4101.

Electrode. Aqueous solution of Cu^{++} salts, which are sol. and polarographically active. This is accomplished by passing amino acids through a short tube filled with Cu phosphate. Aq. $(NH_4)_2S$ was used as permeating liquid. VI Possibility of utilization of maxima for the detection of organic substances in a solution permeating from a chromatographic column. During recent investigations of chromatographic analysis of tech. DDT when testing the

graphically. During recent investigations of chromatographic analysis of fecal DDT, when testing the effluents from the chromatographic column (fill: pulverized rubber, swollen by means of isooctane), a min. could be detected by means of a chromatopolarographic method. This min. preceded two peaks corresponding to reduction of DDT isomers. This min. is attributed to the formation of a surface-active substance in the process. In order to properly select exp. conditions, polarographic detection of "inactive" substances may be possible if pulverized rubber free from surface-active substances is used. Cf. to Adam J. Pikor

The study of 12 cases of scoliosis with paraplegia are the basis for a discussion of clinical features, mechanogenesis and treatment of this condition. It is felt that the majority of these cases requires operative treatment; relief of pressure on the spinal cord with its transposition and wide incision of the dura should be performed. When a favourable situation permits it, spine fusion may be carried out at the same time. Satisfactory results were obtained in patients operated upon early but in cases of long-standing paralysis the results were poor.
